Field Notes - 1

A reliable investigation begins by separating observation from explanation.

Record what changed, identify the constraint, and avoid treating the first plausible story as proof.

Field Notes - 2

Useful tests change one meaningful condition while preserving the rest of the situation.

A failed test is evidence when its prediction was stated before the result was observed.

Figure 1. A small feedback loop for iterative learning.

Field Notes - 3

Revision is not erasure. Keep the earlier model, name the evidence that challenged it, and state the new boundary.

The strongest explanation is the one that survives comparison with credible alternatives.
